Quality milk filtration

DeLaval milk filters protect your quality milk. Our unique, high technology filters keep foreign particles out of your milk, plate cooler and cooling tank.

DeLaval offers a wide range of milk filters to fit your specific installation and farm conditions. All our milk filters are food grade certified and provide the ideal combination of sediment retention, flow rate and wet strength.

Milk must be protected to ensure it is delivered free of dirt and solid waste products. Regularly replaced, quality milk filters protect your milk from these particles. Bits of dust, straw, manure, hair and insects will inevitably enter the milking system during milking, travelling through the cluster and pipelines to the receiver. When replaced at regular intervals, quality milk filters will help protect your milk from these unwanted particles.

DeLaval offers a wide range of milking filters to fit your specific installation and farm conditions.

Our white 60 filters give safe and efficient filtration. These filters are available in various sizes to fit your specific milking system requirements.

The white 70 filters offer excellent flow rate and are specifically suited to high volume milking.

Our blue 80 filters are designed to give maximum wet strength and filtration. The blue colour also provides an extra milk quality check against mastitis because clots or flecks in the milk are more easily seen against a blue background.

DeLaval milk filters are food grade certified to ensure they are safe to use in contact with food. They also provide the ideal combination of sediment retention, flow rate and wet strength.

Finally, the hygienic DeLaval stainless-steel filter holder will keep your milk filters conveniently, organized and clean.

It pays to replace in time

Always replace DeLaval milk filters after every milking, or on a regular basis when using VMS – to ensure you maintain correct hygiene in your quality milk production.
